## Tigers are Disappearing

Tiger numbers have been declining for a century. Though tiger populations are stable or increasing in India, Nepal, Bhutan, Russia and China, only an estimated 3,900 tigers left in the wild, less than the amount of captive tigers in the US. Much more work is needed to protect this species if we are to keep this animal from continued decline and crisis.

Poaching, retaliatory killings, and habitat loss are all constant threats to tigers across their native countries. They must fight for space with dense, frequently expanding human populations.

## Why Do Tigers Matter?

Tigers are unique animals that play a central role in the health and diversity of ecosystems. It is an apex predator located at the top of the food chain, controlling wild hoofed populations and maintaining a balance between prey herbivores and the plants they feed on. Because all they do to control and maintain habitats, they are important for humans too. They help preserve our land.

Tigers have the potential to directly assist some of the world's poorest people. Tourists go to areas where tigers live, providing monetary opportunities. Tiger conservation efforts can assist rural communities in creating revenue and job possibilities by providing alternative occupations.

## What Are We Doing?

We host campaigns and fundraisers to collect donations. Even the smallest donations can make a difference. Little by little, it adds up.

We are building sanctuaries, restoring habitats, and working with trained professionals to rehabilitate the endangered tigers.

We focus many of our efforts on preventing poaching and illegal trade of tigers on black markets across the world.

## Join Us

and help us save the tigers.
